

# Chamber of Commerce Weather Expected for the Upcoming Week

The upper level pattern across the United States has begun to shift again with the trough that plagued the region over the last few days moving out to the northeast as ridging builds in from the southwest.

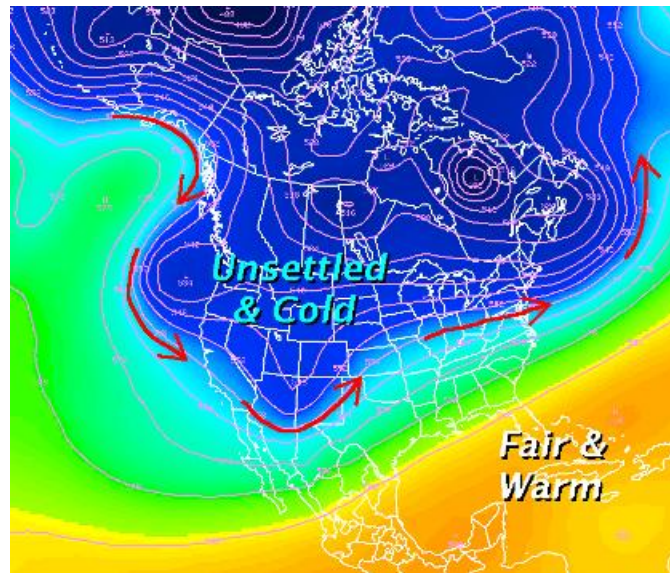

*Upper level pattern expected Monday with red arrows indicating approximate position of the Jet Stream.*

This ridge will continue to build across Florida through midweek as an upper level disturbance moves through the trough into the south central United States.

*Upper level pattern expected Wednesday with red arrows indicating approximate position of the Jet Stream.*

The ridge will then weaken some and become flatter and more suppressed to the south by late in the week as the upper level disturbance moves by to the north.

*Upper level pattern expected Friday with red arrows indicating approximate position of the Jet Stream.*

Overall it looks like we will see generally fair and seasonably warm conditions through the week with daytime highs climbing into the mid 70s to lower 80s. The only exception will be close to the coast where gulf water temperatures in the 50s to lower 60s, as seen in the image below, will be slow to recover keeping area beaches in the 60s to lower 70s.
